**In the 2023 version** you will find:

50 genera, 90 species, 130 specimens

Some of them have not yet been scientifically investigated and subsequently described.

Madagascar's original nature is disappearing every year through logging and burning, often even in protected areas. The increase in population here is **alarming**, about tenfold in the last 100 years.

### **Three examples for all!**

1. Moramanga - About 5 km long and 300 m wide rest of the original rain forest, 4 km east of Moramanga, to the right of the road from Antananarivo to Toamasina was destroyed in 5 years, between 1995 and 2000. The wealth of the species of this locality and a few the species that are shown in the article. This destruction was caused by two families that settled in the valleys on both sides of the hill.

2. Ambohitantely - The last rest of the rain forest of the central Madagascar, about 130 km north of Antananarivo, is repeatedly burned and will probably cease to exist. Countless endemites of this forest will disappear irreversibly. The protection of this habitat is completely useless.

3. Bora - The largest remnant of the Sambirano formation, at the end of the summer of 2001, was reduced to ashes. The ruins of this unique forest are located east of Antsohihy, in northern Madagascar.

preparing:

**Coleoptera of Madagascar**

**Cleridae of Madagascar**

**Cerambycidae (Prioninae) of Madagascar**

**Cerambycidae (Spondylininae and Cerambycinae) of Madagascar**

**Cerambycidae (Lamiinae) of Madagascar**

etc

**COLEOPTERA**
